The definitive treatment textbook in psychiatry, this fifth edition of Gabbard's *Treatments of Psychiatric Disorders* has been thoroughly restructured to reflect the new DSM-5® categories, preserving its value as a state-of-the-art resource and increasing its utility in the field. The editors have produced a volume that is both comprehensive and concise, meeting the needs of clinicians who prefer a single, user-friendly volume. In the service of brevity, the book focuses on treatment over diagnostic considerations, and addresses both empirically-validated treatments and accumulated clinical wisdom where research is lacking. Noteworthy features include the following:

Content is organized according to DSM-5® categories to make for rapid retrieval of relevant treatment information for the busy clinician. Outcome studies and expert opinion are presented in an accessible way to help the clinician know what treatment to use for which disorder, and how to tailor the treatment to the patient. Content is restricted to the major psychiatric conditions seen in clinical practice while leaving out less common conditions and those that have limited outcome research related to the disorder, resulting in a more streamlined and affordable text. Chapters are meticulously referenced and include dozens of tables, figures, and other illustrative features that enhance comprehension and recall. An authoritative resource for psychiatrists, psychologists, and psychiatric nurses, and an outstanding reference for students in the mental health professions, Gabbard's *Treatments of Psychiatric Disorders, Fifth Edition*, will prove indispensable to clinicians seeking to provide excellent care while transitioning to a

DSM-5® world.

This book is about children who do not acquire language normally, their characteristics, and how to help them successfully develop language skills. It begins with an overview of the aspects of normal language, looking at the bases of language and communication and at normal language development in children and adolescents. Here readers get a review of the concepts, as well as an introduction to the rest of the book. The central focus of the book features nine chapters on the language difficulties of different groups of children, including groups defined by the age of the children in combination with an etiological condition, for

example preschoolers with specific language impairment and adolescents with language impairment, and groups defined by concomitant or etiological conditions associated with the children's language difficulties, for example autism spectrum disorder. Included in this section are discussions of children's language associated with learning disability, intellectual disability, autism spectrum disorder, auditory impairment, linguistic and cultural diversity, acquired language disorders, and specific language impairment. Adolescents with language impairment, as well as language of other special populations of children, such as gifted children and those with cleft palate, are also explored. The final part of the text presents more detailed discussions of language

intervention, including augmentative and alternative communication as it relates to children with language disorders and their interventions; language assessment; and the procedures used and factors considered in intervention with children with language disorders. Thoroughly updated to reflect the most current knowledge in the field, the new edition also includes current information about federal education laws and initiatives that affect services for children with language disorders.
