Polymyositis and Dermatomyositis provides extensive information regarding Polymyositis and Dermatomyositis (PM/DM), which is described as a heterogeneous disease complex. This book is divided into four sections: Part I (Clinical Features) covers the classification of PM/DM, details of the clinical presentation, and the disease's association with the other connective tissue disorders and malignancies. Part II (Etiology and Mechanisms) covers advances in the immunopathology and viral etiology of PM/DM along with a frequently recognized entity: inclusion body myositis. Part III (Diagnosis and Treatment) covers the histologic, muscle enzyme histochemical, electron microscopic, and resin histology features of PM/DM along with those electromyographic features that could help make a more accurate diagnosis. Part IV (Overview) summarizes the issues that may not have been clear and highlights differing and unsettled views or present available data. This text is directed to clinicians in private practice or in academic institutions concerned with PM/DM patients, including neurologists, rheumatologists, pediatricians, dermatologists, physiatrists, and neuromuscular investigators. This book is intended as well for neuromuscular pathologists who interpret muscle biopsy specimens and electromyographers who perform EMG studies to help determine the clinical diagnosis. Management decisions on appropriate practices and policies regarding tropical forests often need to be made in spite of innumerable uncertainties and complexities. Among the uncertainties are the lack of formalization of lessons learned regarding the impacts of previous programs and projects. Beyond the challenges of generating the proper information on these impacts, there are other difficulties that relate with how to socialize the information and knowledge gained so that change is transformational and enduring. The main complexities lie in understanding the interactions of social-ecological systems at different scales and how they varied through time in response to policy and other processes. This volume is part of a broad research effort to develop an independent evaluation of certification impacts with stakeholder input, which focuses on FSC certification of natural tropical forests. More specifically, the evaluation program aims at building the evidence base of the empirical biophysical, social, economic, and policy effects that FSC certification of natural forest has had in Brazil as well as in other tropical countries. The contents of this volume highlight the opportunities and constraints that those responsible for managing natural forests for timber production have experienced in their efforts to improve their practices in Brazil. As such, the goal of the studies in this volume is to serve as the foundation to design an impact evaluation framework of the impacts of FSC certification of natural forests in a participatory manner with interested parties, from institutions and organizations, to communities and individuals.

Muscle Function Testing provides information pertinent to the muscle functions. This book evaluates the method of examination that provides information about the strength of individual muscles or muscle groups that form a functional unit. Organized into three sections encompassing four parts, this book begins with an overview of the size, extent, and progress of peripheral nerve lesions. This text then discusses the nature of the simple movement pattern seen in muscle function testing. Other chapters consider the conditions for analytical physiotherapy and determination of the work capacity of the part of the body being tested. This book discusses as well the possible errors and mistakes that might occur during testing and might decrease the validity of the assessment. The final chapter deals with the demand for a better and a more rational method to therapeutic exercise. This book is a valuable resource for physiotherapists, orthopedic surgeons, physiologists, neurologists, and rheumatologists.

NeuroKinetic Therapy is based on the premise that when an injury has occurred, certain muscles shut down or become inhibited, forcing other muscles to become overworked. This compensation pattern can create pain or tightness. By applying light pressure that the client then resists, the practitioner can evaluate the strength or weakness of each muscle, revealing the sources of injury and retraining the client's body to remove the compensation patterns—reprogramming the body at the neural level. This easy-to-follow practitioner's manual presents a series of muscle tests specially designed to uncover and resolve compensation patterns in the body. Author David Weinstock begins by explaining how this approach stimulates the body and mind to resolve pain. Organized anatomically, each section of the book includes clear photographs demonstrating correct positioning of the muscle accompanied by concise explanations and instructions. Labeled anatomical illustrations appear at the end of each section showing the relationships between the muscles and muscle groups. This essential resource is especially useful for physical therapists, chiropractors, orthopedists, and massage therapists looking for new ways to treat underlying causes of pain.

Abstract: BACKGROUND AND PURPOSE: Manual muscle testing is the most commonly used procedure to assess patient strength. The purpose of this study was to determine the consistency in which physical therapists assign manual muscle testing grades. SUBJECTS: The subjects were 38 volunteer physical therapists from various clinical settings. All subjects had at least two years of clinical experience. METHODS AND MATERIALS: Subjects were instructed to apply either minimum, moderate, or maximum pressure which corresponded to assigning a grade of fair plus, good, or normal according to the Kendall system, respectively. The pressure was applied through the Nicholas Manual Muscle Tester to the right hip flexor muscle group of the researcher. A retest was performed approximately two weeks following the initial test. STATISTICAL ANALYSES: The absolute value of the difference between the initial test and retest was used to compare consistency of each subject. Paired samples t-tests were used to test for differences from the initial test to retest for each force level. A 2 X 3 repeated measures analysis of variance (ANOVA) was used to compare force means among force levels and between test days. The standard error of the measure (SEM) was calculated to estimate the precision of measurement made by examiners at each force level and test day. RESULTS: No significant difference was found between the initial test and retest for any of the force levels. Inconsistencies were found between the initial test and retest for each subject at each force level. Inconsistencies in the amount of applied pressure were found between subjects at each force level. Subjects were found to be the most inconsistent when applying maximum pressure. CONCLUSION: Clinicians were unable to reproduce the same force from initial test to retest. Clinicians also varied in the amount of pressure they perceived as minimum, moderate, and maximum. RELEVANCE: Inconsistencies in assigning grades exist; therefore, manual muscle testing may not be the most clinically useful measurement of strength.
